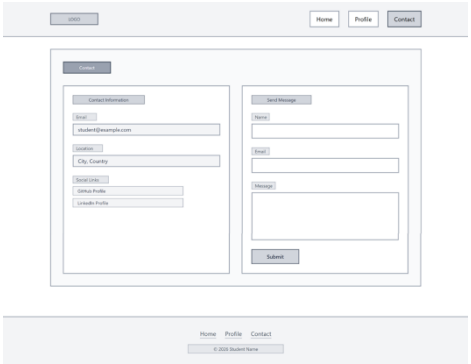
Design Explanation

This personal academic portfolio was designed to present essential information in a clear, organized, and professional way. The main goal was to create a simple website that reflects my academic identity, skills, interests, and contact information while keeping the layout easy to read and responsive on different screen sizes.

The design follows a mobile-first approach. The content is arranged in a single-column structure on smaller screens and expands into wider layouts on larger screens. This makes the website usable on phones, tablets, and desktops without losing clarity or balance.

The layout uses Flexbox for the navigation bar and the main profile area to align elements neatly and keep spacing consistent. CSS Grid is used in sections such as interests, technical skills, and academic projects to organize content into structured cards. This combination helps the page stay flexible and visually balanced.

Accessibility was also an important part of the design. Semantic HTML elements such as header, nav, main, section, and footer were used to improve structure. Images include alternative text, and form fields use labels connected with the correct for and id attributes. A visible focus style was also added to support keyboard navigation.


The visual style is intentionally minimal and academic. Neutral backgrounds, soft borders, simple typography, and light accent colors were chosen to keep attention on the content rather than decoration. The final result is a clean personal portfolio that is suitable for an academic web application assignment.
